Website Testing: 25/01/2023

Feature implemented by: Saahil Shah (ss2357)

Feature tested by : Tope Balogun (tb520)

</div>

Functionality Testing: (Errors Fixed)

<u>Login</u>

- Entering email, password. ✓

- Show password feature for password and confirm password: eye icon displays but when clicked on, the password does not appear in text ✓   Fixed by adding an event listener, which when clicked on, it changes the type field from password to text and vice versa

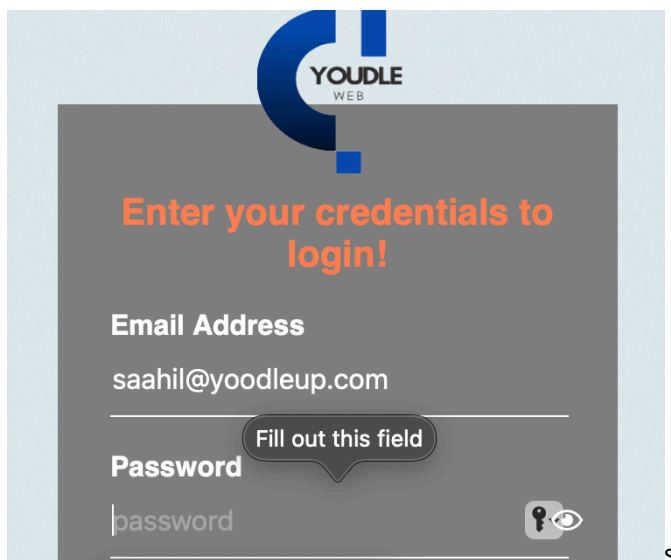

- "Forgot password?" link works fine and once clicked, it takes you to the Forgotten password page to change it. ✓

- Registration and Homepage button: Works fine and each button takes the user to its respective pages. ✓

- Login Now button function : after entering the details, and clicking in the button, an error is shown. ✓

  Fixed by Adding an aql statement that queries the database table to display all users with the same email and password as that inputted, if there is a result then that means user has already been registered and is authorised to login

- Incorrect details typed: Works fine as the details entered are cross-checked with the details in the database and if there is no user with that email and password then an error message appears. ✓

incorrect email or password!, Please Register first!

Close

- Both email and password must be provided in order for the form to submit successfully: works fine

  as an error is shown if any one of the fields is empty ✓
